Technology that supports fine, brilliant picture quality.

■ Megapixel CCD

The DZ-GX20E is equipped with a megapixel CCD having a total of 2.12 million pixels, 1.23 million of which are effective with moving pictures, and 1.92 million for still pictures. It faithfully recreates the coloring and even the texture of delicate skin. The DZ-MV780E has a total of 1.33 million pixels, 690,000 of which are effective with moving pictures, and 1.1 million for still pictures.

DZ-GX20E
Approx. 2.12 million pixel image
resolution 1/3.6" CCD

DZ-MV780E
Approx. 1.33 million pixel image
resolution 1/4.5" CCD

■ High performance multi-coated aspherical lens

The high performance aspherical lens greatly reduces peripheral blurring and degraded sharpness. And multi-coating prevents reflections that cause flaring and ghosting. You're assured of high image quality every time you shoot.

■ Image processing LSI

Linking the high picture quality Image Processing LSI that restricts noise to reproduce natural coloring with the high quality MPEG2 LSI that achieves high picture quality conversion to MPEG2 gives you astonishingly high resolution images. It also reduces power consumption.

■ New compact DVD drive

To simplify handheld recording and improve portability, these models use a DVD disc that has no cartridge (improved coating of disc format). Making the DVD drive more compact resulted in a slimmer camcorder body.

The many user friendly functions
let you take high quality video with ease.

DVDCAM

16:9 wide mode

The DVD Camcorder can record video in 16:9 wide mode equal to that of a wide television. Because it uses the surplus pixels of the CCD sensor to take video at a wide ratio, the picture quality is as good as it is at 4:3, so you enjoy beautiful and powerful images.

XTRA mode (VBR recording)

The camcorder instantaneously judges the state of the subject to control the bit rate. When the subject is moving or changing rapidly, the bit rate is high, but when the subject is moving only a little, it reduces the bit rate to save disc storage space.

* XTRA mode recording can be done on both DVD-RAM and DVD-R discs.

Electronic Image Stabilizer (EIS)

An EIS hand-shaking compensation function is available, which can also be used during wide screen recording.

Digital slow shutter

The DVD Camcorder automatically controls the shutter speed according to the brightness around the subject. In low light mode, it can record accurately even in poor light.

* When digital slow shutter is operating, afterimage lag of moving subjects may occur.

Support light

When you use low-light mode, to record a child's sleeping face, for example, you can use the LCD screen as a support light by turning it around to face the subject.

* When digital slow shutter is operating, afterimage lag of moving subjects may occur.

Still picture video flash (DZ-GX20E)

A video flash is housed in the side of the camcorder. It flashes automatically when you take a still picture in a dark place.

Photo button

The unit is equipped with a photo button used exclusively for taking still pictures. You can fix the focus by pushing the button half way, so you can take your picture after confirming that it is in focus.

Quick mode

A menu display shows only the frequently used basic functions. Because it displays explanations of the functions, even someone not used to operating a video camera can use it with confidence.
